

Library Website Usability Study Report

Azka Qasim, Atharva Nayak, Arnav Sharma, Natalie Cheng

INFO-644-02: Usability Theory & Practice

Executive Summary

The usability study of the University of Alberta Library website aimed to evaluate how effectively users can navigate and utilize its features. The study identified key areas for improvement and provided actionable recommendations to enhance user experience.

The primary objectives of the study were to determine whether new users can understand and navigate the library website's services and features, identify the most frequently used features by students, and assess their experiences using them. Additionally, the study aimed to provide recommendations to improve the website's organization, clarity, and usability, particularly focusing on the "All Library Services" page.

To gather insights, **8 University of Alberta students** participated in **moderated usability testing** conducted via Zoom. Half of the participants were SLAC members, while the other half were general students. Each participant completed 16 tasks while sharing their screens and providing feedback.

Our research uncovered four key spaces for improvement with the library's website:

- 1) The first fold of the home page is well structured, but the content on the remaining page may not be relevant to most students.
 - **Recommendation:** Restructure the home page to add valuable context to the first fold while providing more relevant content for students in the subsequent folds.
- 2) Students often check the hours and locations when planning a visit but are unsure which library is most appropriate for them.
 - **Recommendation:** Categorize locations by campus and type to increase relevant discovery, and display the day's hours upfront.

3) Navigating to specific subject guides is difficult due to unclear grouping and multiple required steps.

- **Recommendation:** Make browsing guides simpler by providing advanced tools and structuring them as collapsible drawers.

4) While the categorization of services is intuitive, the overwhelming layout of the page makes it difficult to locate services.

- **Recommendation:** Reorganize services into a grouped listing with descriptions, while boosting popular services.

Introduction

The University of Alberta, located in Edmonton, Canada, is one of the top research-intensive institutions in the country. It is known for its academic excellence, innovation, and global impact. UofA offers a wide variety of programs across 18 faculties, ranging from engineering, medicine, and sciences to business, arts, and humanities, attracting students from over 150 countries. The university is renowned for its contributions as a hub of groundbreaking research in artificial intelligence, energy and environmental sustainability.

When a university is so integral to the research landscape of various academic fields, its library is naturally a place of huge interest. The University of Alberta's Library offers a vast collection of books, journals, and digital material to support students, faculty, and researchers in their academic pursuits. It forms an important part of the ecosystem that produces compelling work in various domains.

As part of this study, the Library wanted to understand how students access and use their website, and which tools and services attract the most attention. They also looked to assess the overall organization and structure of the website's navigation. The aim of this study has been to learn from students' experiences and behavior when using the website to identify gaps and suggest recommendations that would eventually make the library's website a more inviting place for young academics taking their first steps in the field of research. This report contains 4 major findings based on the website's main pages and includes recommendations along with screenshots of annotated designs on how these can be implemented. These recommendations range from low to high intervention changes based solely on the findings of the study.

Methodology

Study Goals

User testing, or usability testing, is when a UX researcher will observe a participant's behavior and feedback as they perform a series of tasks and answer questions about a product or design. This method allows the researcher to identify issues, assess a user's intuitive behavior, and iterate on the current design (Moran, 2024). Like many other scientific research methods, usability testing can be qualitative or quantitative. In user testing, qualitative testing will focus on insights and anecdotes, while quantitative will measure task success or time to completion. For the purpose of this study, **we performed a qualitative user testing study** to evaluate the usability of the library website and pinpoint different user behaviors and frustrations.

By collaborating with the clients, we developed **four main objectives** that we sought to achieve through our study:

1. Determine whether a new user can understand and navigate to the services and features offered by the library website (e.g. calendar, booking, and support for planning library visits.)
2. Learn about the features students use most frequently and their experience using them.
3. Provide recommendations to improve the organization, clarity, and usability of the website and its features.
4. Assess the usability of the "All library services" page for various services (Digital Preservation + Collections, Research + Publishing Support, Technology, etc.)

User profiles & recruitment

We first met with our clients to discuss the types of users they wished to target through this usability study. There are plenty of students who use the library website frequently,

as well as those who have never visited it at all. We decided it would be best to conduct the study with **two main user profiles**. Ultimately, all participants were to be both undergraduate and graduate students recruited from the university.

1. UAlberta student - Frequent user (4 participants)

Frequent users will engage with the library and its website often. These participants were recruited by the clients through the Student Library Advisory Committee (SLAC). Students from this committee are regularly involved with the library and its services and are familiar with the website's functions.

2. UAlberta student - Unfamiliar user (4 participants)

Unfamiliar users may not have engaged with the library website at all before, or very seldomly. These participants were recruited from the university's weekly email digest which is sent to all students (**Appendix E**).

We chose to split the user profiles into two to better understand how all types of users are using the website. Those who are more familiar can help in understanding what works well for those who have gotten used to the website, while those who are not as familiar can help identify pain points or elements that are not relevant to them. Both profiles are essential in gauging the overall usability of the website.

A PanelFox screening questionnaire was sent to the weekly digest as well as all of the SLAC members. Because the questionnaire was only sent to students, we did not need to screen out anyone, and we chose who to proceed with for interviews based on their year level, how frequently they visit the site, and what they use the site for. The full questionnaire is in **Appendix C**.

We aimed to invite students from the widest variety of year levels and how often they use the site. We did not receive any answers for a frequency of "Never", and only one for "Rarely". Out of those who answered "Sometimes", we invited those who only selected

one or two options for question 4. This ensured that we would be able to test a wider range of website familiarity across the participants. An in-depth view of the screener answers and participant demographics can be found in **Appendix A & D**.

Interview tasks

Based on the study goals that we had created previously, we designed a few tasks and questions based on the main library website pages and services that would take users around the biggest features of the website and help us gain insight into our main objectives.

We divided the tasks to assess two main groups below with post-test questions included. Our screener questions acted as pre-test questions as they assessed a user's familiarity with the website and the functions they use it for but were encouraged to speak on it more at the beginning of the interview.

The complete task list can be found in Appendix F.

Testing protocol

Each participant we selected for a moderated remote interview was sent an email invitation which prompted them to select a time to schedule with our team. The open slots were selected based on the availability of the researchers to ensure that at least two researchers could be present per interview.

One researcher facilitated the interview and instructed the participant through the test, while the secondary researcher was present to record notes on observed participant behavior and feedback. The time allotted for each session was an hour, but each interview only lasted 30 minutes on average. The team utilized Zoom to conduct and record each interview if participants gave verbal consent for recording. Participants were instructed to first share their screen with the university's website pulled up. They were also asked to "think aloud" and voice their thought processes and reasoning as they proceeded with the tasks and questions.

Evaluation & Data Collection

Upon completion of all 8 interviews, the research team consolidated their notes and important observations into a FigJam board. Each participant was placed in a row and each task or question was placed into a column. The notetakers for each interview put relevant and key information onto a singular sticky note that would then be rearranged into an affinity diagram.

To create the affinity diagram, the researchers took sticky notes with similar themes and placed them together in a group. After creating multiple groups, they were named according to the group's main shared insight and issues were targeted accordingly. The full notes and affinity diagrams can be found in **Appendix B**.

Overall Findings

We looked to assess the usability of the library website according to four parameters that would help us judge the key uses of the website and gaps that can be filled to better assist students' academic journeys. On the basis of our usability tests, we were able to uncover **4 key opportunities to improve the user experience** of the library website. While we were unable to ascertain the effectiveness of the overall IA, we believe tackling these issues under the current structure would also immensely help in reducing the barrier of entry to the library for new students.

Our key findings are:

1. Home page:

The first fold of the website provides the most important functions of the website (search, research tools and featured services) in a well-organized manner that is easy to use. However, the content in the subsequent sections does not engage users enough due to a lack of relevance.

2. Hours and Locations:

Users intuitively gravitate towards this page when wanting to plan a visit to the library. They always look at the day's hours. While experienced visitors know which location is best suited to them, new visitors find it difficult to understand which library location is most suitable for them.

3. Subject guides:

Users do not fully understand the relevance of subject guides and how to use them. Furthermore, they find the organization of the content complex due to unexpected grouping. This, along with requiring multiple clicks to reach a specific guide, makes the discovery of specific guides complicated.

4. Library services:

The services page organizes the various services into intuitive categories, but the

structure of the page is deemed cluttered by users. Furthermore, certain services were difficult to identify by just their names. These factors lead to difficulty in finding services, even with prior knowledge.

Along with these key findings, we were also able to gain **insight into broader user behavior** pertaining to the usage of various library resources:

1. Researching with the library:

While users know how to look for known material through search, they do not understand how to use other resources like databases, subject guides and eJournals. When approaching research projects, they require help in finding and using such resources and may contact the helpdesk as needed.

2. Academic support:

Students are unaware of the various resources at their disposal at the library. They do not know how the library can provide support in their academic journey, and may not even know about the existenceexistence of subject librarians. They opt to seek help from their professors in such instances.

3. Booking study spaces:

This is the most used service at the library (based on our limited research). Students often simply google “Book Study Space UAlberta” when wanting to book a space as they look to bypass the need to navigate to this page on the website. When booking a room, they usually look for availabilities in their preferred libraries and compare different spaces on the basis of facilities available such as windows, heating/cooling, etc.

4. Gathering course materials:

Students find all their study material on the course page and do not use the library for the same. If they need to get a prescribed book from the library, they will simply search for it and put a hold on it. They are also unsure about the material being up to date on the library website.

Key Findings and Recommendations

#1: Home page

INSIGHT

The first fold of the home page is well structured, but the content on the remaining page may not be relevant to most students.

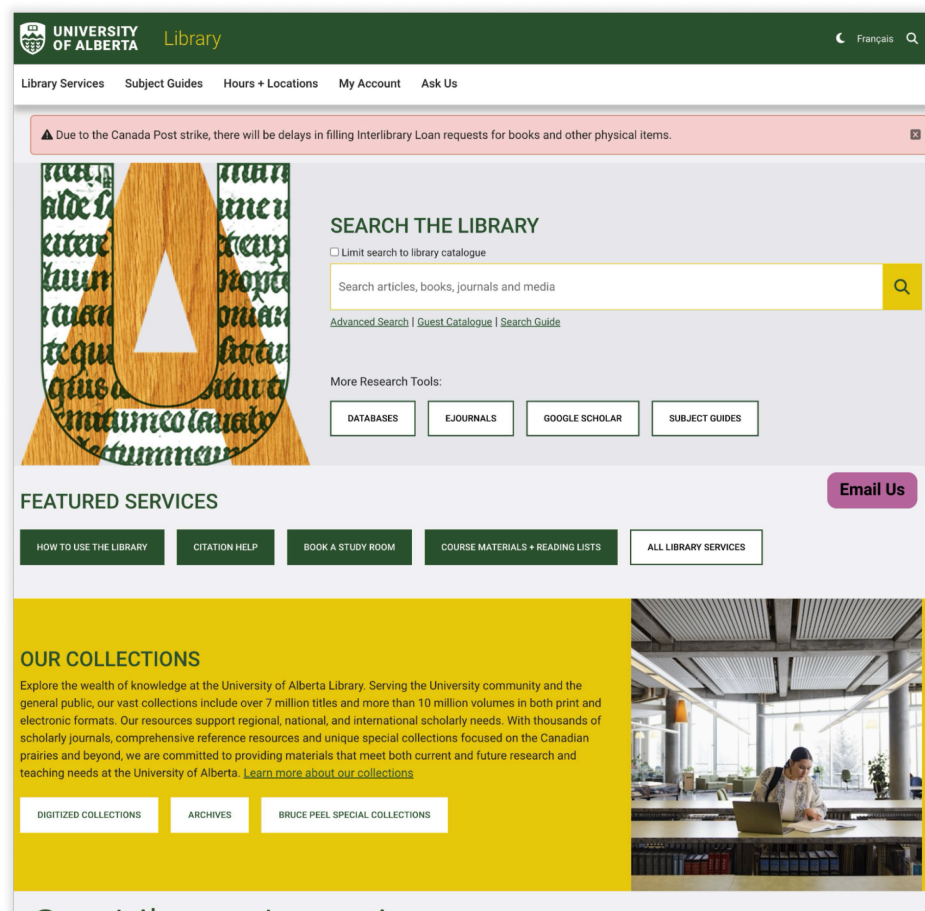

Figure 1.1 Glimpse of the current home page.

The home page's overall structure was praised by all testers, with **7 out of 8 saying they use the search** functionality that is showcased on the first fold. The structure of this fold is meaningful as it provides the most relevant tools in the initial view of the page.

“I like that everything I need is visible in this first view... I usually don’t go below it.”

Interviewee #1 talking about the home page

However, the scope of improvement lies in the content displayed on the rest of the page. **5 of the 8 testers did not intuitively scroll** below the first fold. On being prompted to explore the page as a whole, **3 of them noted that usually do not view the sections below** as they do not find those sections relevant. Information related to special collections, news, events and statistics were called out as irrelevant by users. One user also mentioned that they feel the website has too much text to view at a glance.

RECOMMENDATION

Restructure the home page to add valuable context to the first fold while providing more relevant content for students in the subsequent folds

1) Add supplemental information to existing tools on the first fold

By **adding “How to use the library” in the website navigation bar**, we improve its discoverability for new visitors. **Site search is made more prominently visible** as an option for those who prefer searching for services and resources, rather than using the website to navigate to them. **Research tools like Databases and eJournals are appended with descriptions** to help inexperienced students understand their utility. (See design in Figure 1.2)

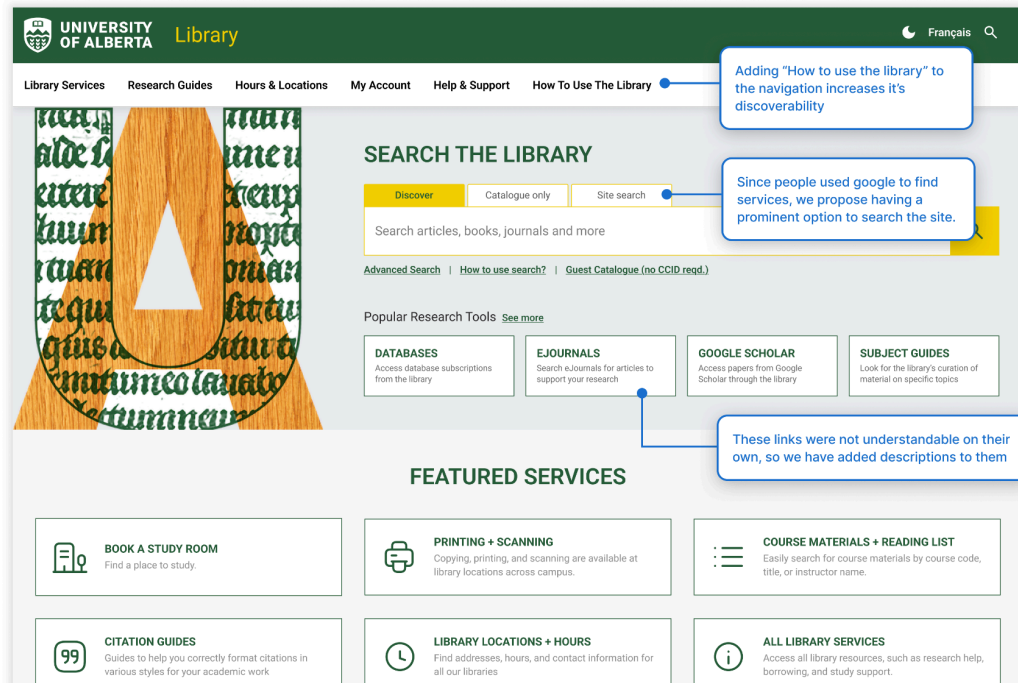

Figure 1.2 The revised first fold of the home page

2) Make “Featured Services” more prominent

The library is more than a collection of books. Increasing the visual prominence of Featured Services, **along with added icons and descriptions, increases the engagement** of the page and helps students better understand the various utilities of the library available to them. (See design in Figure 1.3)

3) Highlight key features from the “How to Use the Library Guide”

Surface interesting features of the library on the home page to **improve user education about how to use library resources**. A more graphical representation of this section also helps reduce the text-heaviness of the page. (See design in Figure 1.3)

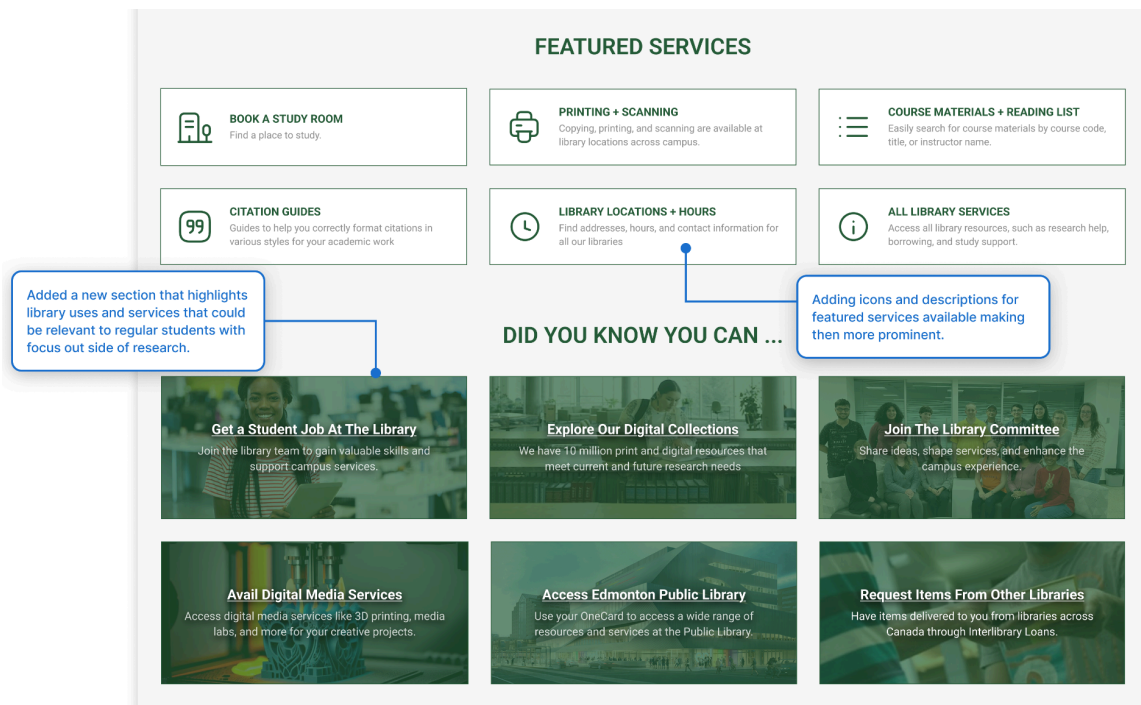

Figure 1.3 Redesigned Featured Services and new “Did you know...” section

4) Guide students on the various research tools available at the library

The screening questionnaire highlighted “Research” as the most common reason why students visit the library. To **increase their understanding of the various tools** at their disposal through the library, include a section focused on research tools to kickstart research projects. These can be divided by type (i.e. services, tools, guides, etc.). (See the design in Figure 1.4)

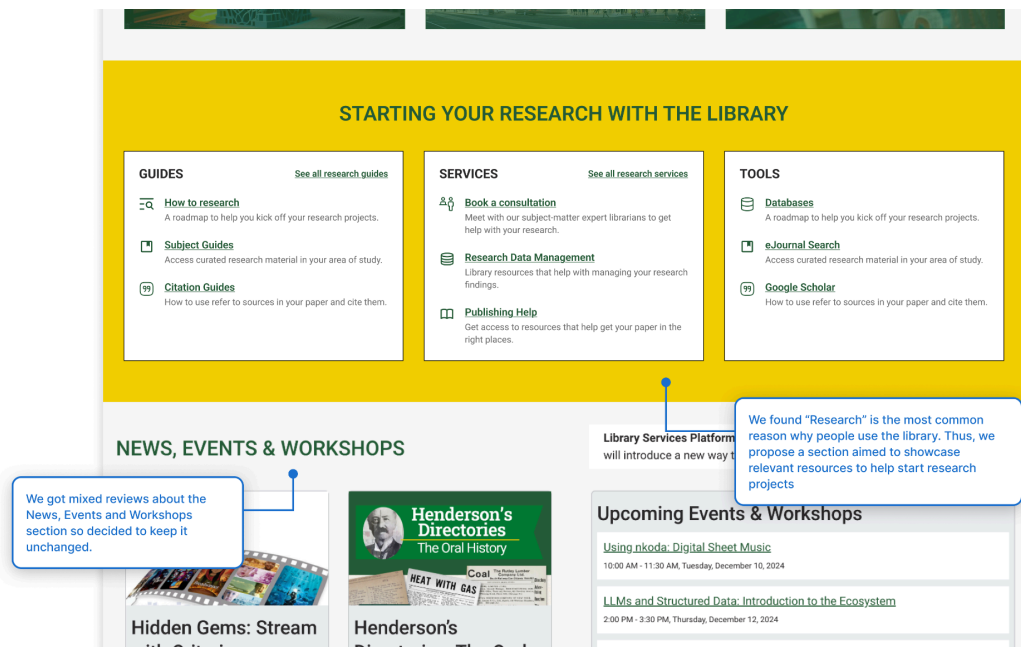

Figure 1.4 “Starting your Research...” section

#2: Hour & Locations

INSIGHT

Students are unsure which library is most appropriate for them.

During the moderated usability test, **5 out of 8 students** visited the Hours & Locations page to plan their library trips, with a particular **focus on checking the day’s hours**. While experienced users of the website are familiar with which libraries best meet their needs, **new visitors often struggle to determine the most suitable library** due to unclear grouping and lack of campus-specific details. This confusion is made worse by the current list order, as noted by one of the interviewees.

“It feels weird that these 2 (Augustana and BSJ) libraries are on top of more common libraries.”

Interviewee #7 on the list order

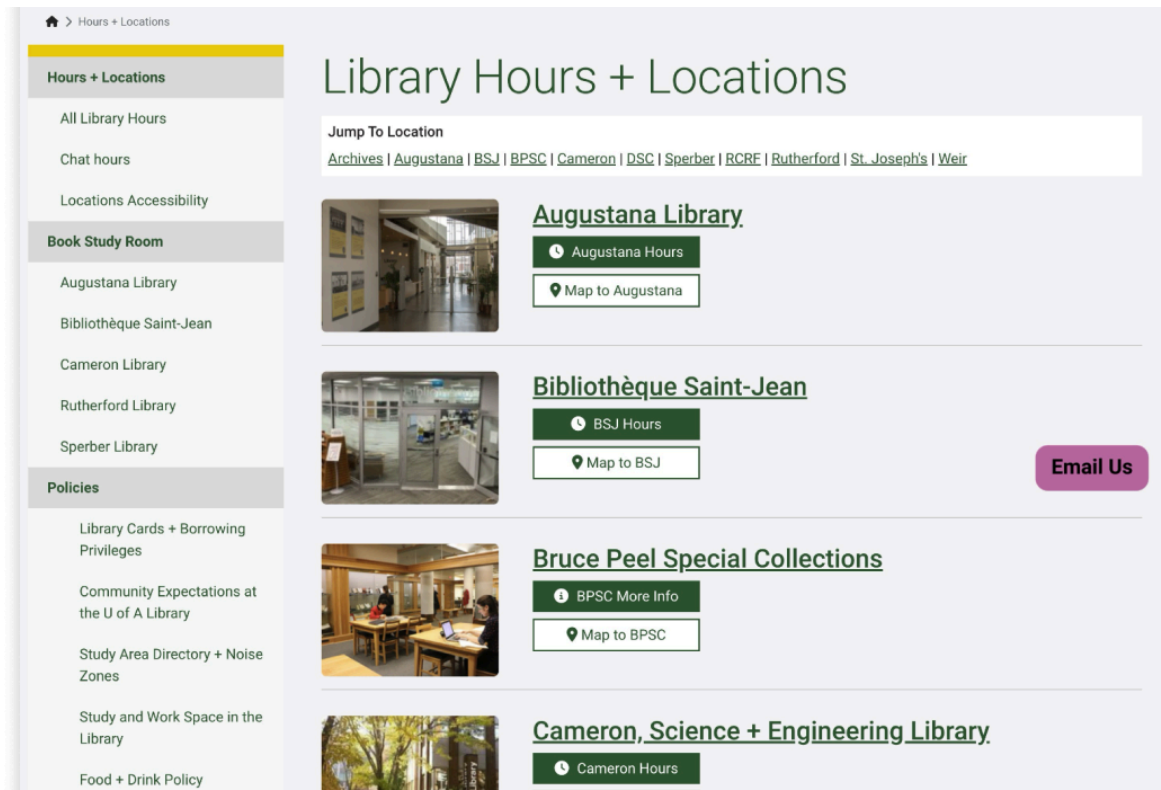

Figure 2.1 The current Library Hours & Locations page.

On the positive side, the side panel and “Jump to Location” options were appreciated for their ease of navigation. However, participants expressed a desire for **clearer organization of library locations by campus and library type**, as well as prominently displayed daily hours for each location.

RECOMMENDATION

Categorize locations by campus and type to increase relevant discovery, and display the day's hours upfront.

1) Group libraries by campus and type

Organize library locations into **clearly defined sections based on campus** (e.g., Edmonton, Augustana, Saint-Jean) and library type (e.g., Archives, collections). This will help new users quickly identify the most relevant options for their needs.

2) Display daily hours prominently

Include "Today's Hours" next to each library's name in the list view, eliminating the need to click through for this essential information. This streamlines the user experience and aligns with their primary goal of quickly finding operational details.

3) Reorder the library list

Arrange libraries in order of popularity or relevance to the majority of users, ensuring commonly used libraries appear first. For instance, place main campus libraries like Rutherford or Cameron higher up in the list.

By implementing these changes, the Hours & Locations page can become a more intuitive and efficient tool, reducing confusion for new users and improving the overall planning experience for all visitors.

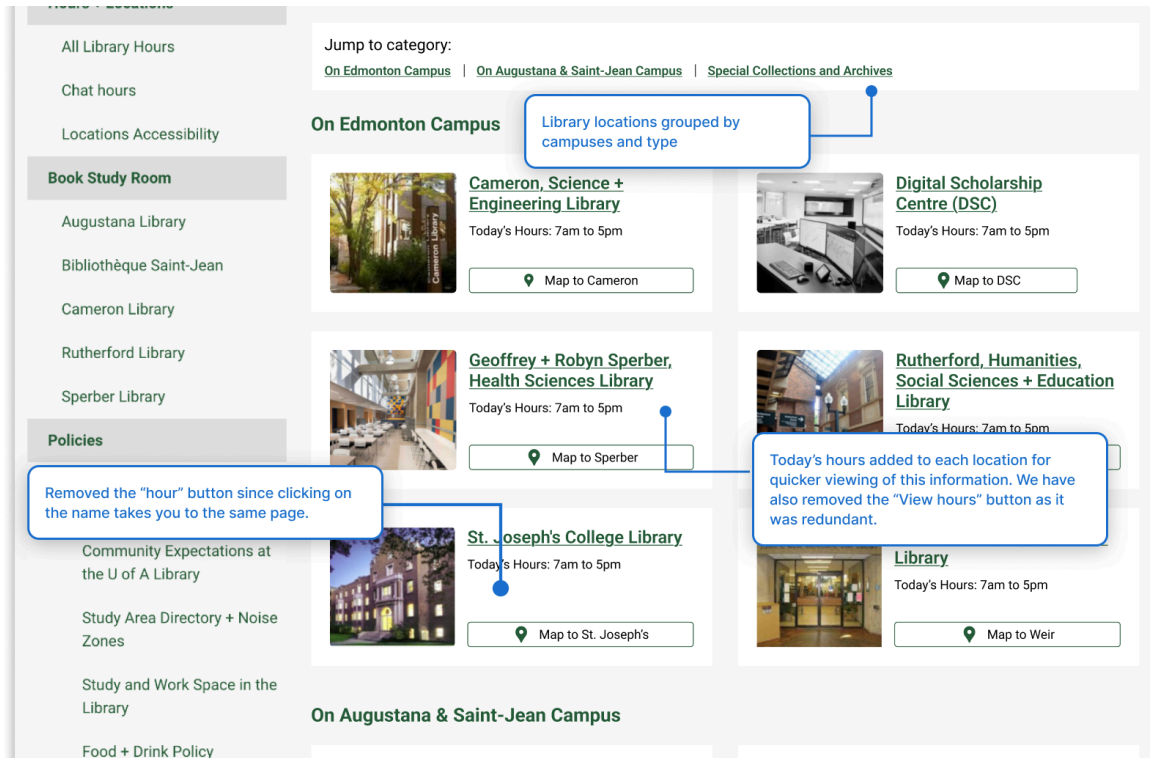

Figure 2.2 Revised Hours & Locations page with daily hours and new organization of libraries by types.

#3: Subject Guides

INSIGHT

Navigating to specific subject guides is difficult due to unclear grouping and multiple required steps.

Upon reviewing the interviews and notes, we found that users appreciated that they could **scan broadly by category** before narrowing in to find a specific guide. Furthermore, they could easily access category-specific databases through the buttons without having to navigate through the entire A-Z database.

A pattern we observed amongst many participants is that they were **not able to easily find their subjects within the guides**. Some students were unsure as to what category a

subject would be under, while others **did not understand what subject guides were even purposed for**. Additionally, a majority of users were scanning the pages linearly (top-down) and oftentimes missed the extra guides available on the sidebar.

“I didn’t think computer science would be under science.”

Interviewee #5 when searching for a guide related to his major

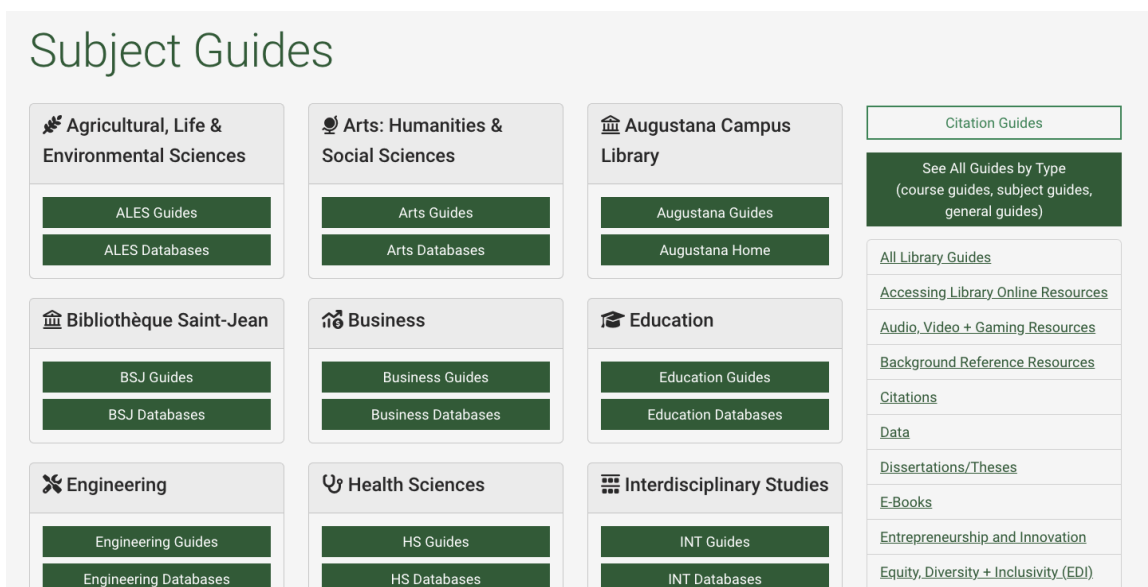

Figure 3.1 Current Subject Guides page.

RECOMMENDATION

Make browsing guides simpler by providing advanced tools and structuring them as collapsible drawers.

1) New features: description, tabs, and search

Add a **page description** and **clear guide tabs** to the top of the page to ensure users are able to scan all necessary information that aligns with the common behavior of viewing the page linearly. Inserting a search function right below these first two elements will

allow users to find exactly what they are looking for without having to browse through the tens of hundreds of guides that exist. See **Figure 3.1** for an in-depth glance.

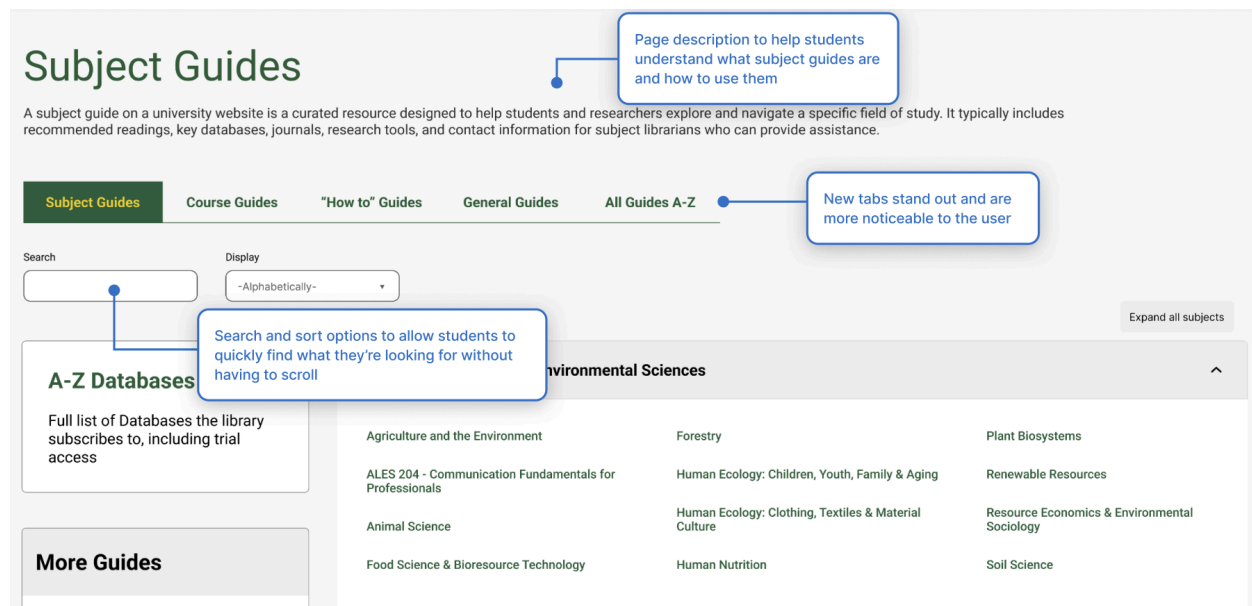

Figure 3.2 Prefold of revised Subject Guides page with description, tabs, and search.

2) Listing the individual guides up-front

Reduce the mystery around the content within each subject by **listing each guide directly on the subject guides page**. With this method, users can compare a subject's content with another without having to visit another page or open another tab. Users can choose to expand or collapse whichever drawers they wish to narrow down their selection, **effectively streamlining the process of scanning for a specific guide**.

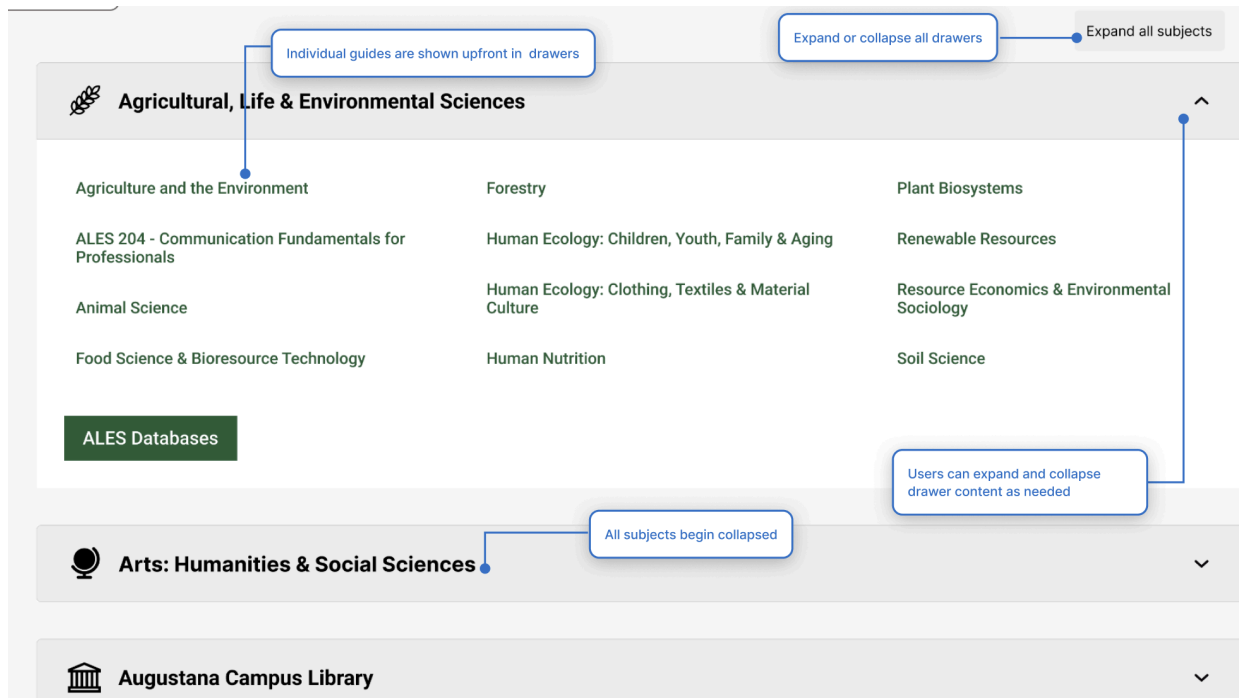

Figure 3.3 Examples of some subject drawers with individual guides inside.

3) Extra details

Due to the nature of a re-design, other elements that were not directly addressed in testing were naturally moved around. Because subject-specific databases are already accessible from the subject guides page, **we added an option for users to access the entire A-Z database** from this page. This way, if a subject or database they are looking for is not present, they do not have to navigate to another page to find it. Additionally, the less important guides that were already contained in the previous sidebar stayed in a sidebar format but moved to the left side to align with the new design.

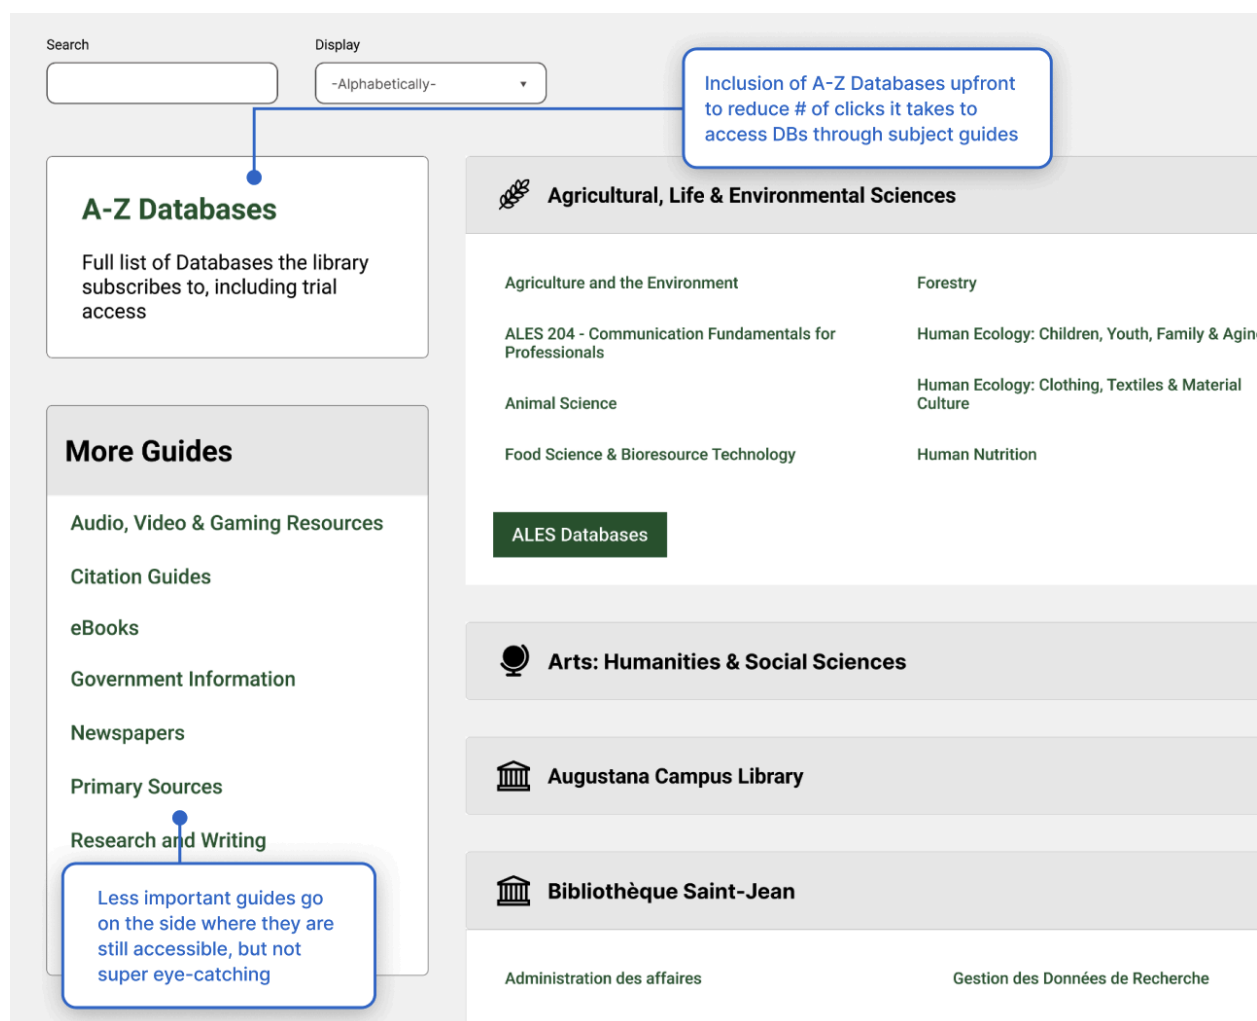

Figure 3.4 New arrangement with A-Z databases included.

#4: Library Services

INSIGHT

While the categorization of services is intuitive, the overwhelming layout of the page makes it difficult to locate services.

The current Library Services page is organized into categories and displayed in columns. Students initially responded positively to the structure and layout, appreciating

the clear categorization of services. However, during testing, we observed significant usability challenges.

The main issue was **information overload**—having all the services displayed at once increased cognitive load, making it difficult for students to locate specific services. One student, unable to find the requested service, gave up and resorted to using “Ctrl + F.” Despite liking the overall design, the sheer volume of options hindered efficient navigation.

We also noticed that **out of the 6 students who had used the page before, 5 interacted with only 2–3 services regularly**, indicating that many services were irrelevant to their needs. For example, undergraduate students had no interest in research services, while teaching support was seen as primarily useful for faculty.

Another challenge was the **lack of descriptions** for services. Students were often unclear about what services were offered. For instance, when asked about “ERA,” most had no idea what it referred to. Misleading or ambiguous service names also added to the confusion. One student assumed “Student well-being” referred to mental health resources, while another thought “Alumni Services” provided job support.

“It’s too much, hard to read, cluttered, and difficult to navigate.”

Interviewee #2 when asked about the organization of the Services page

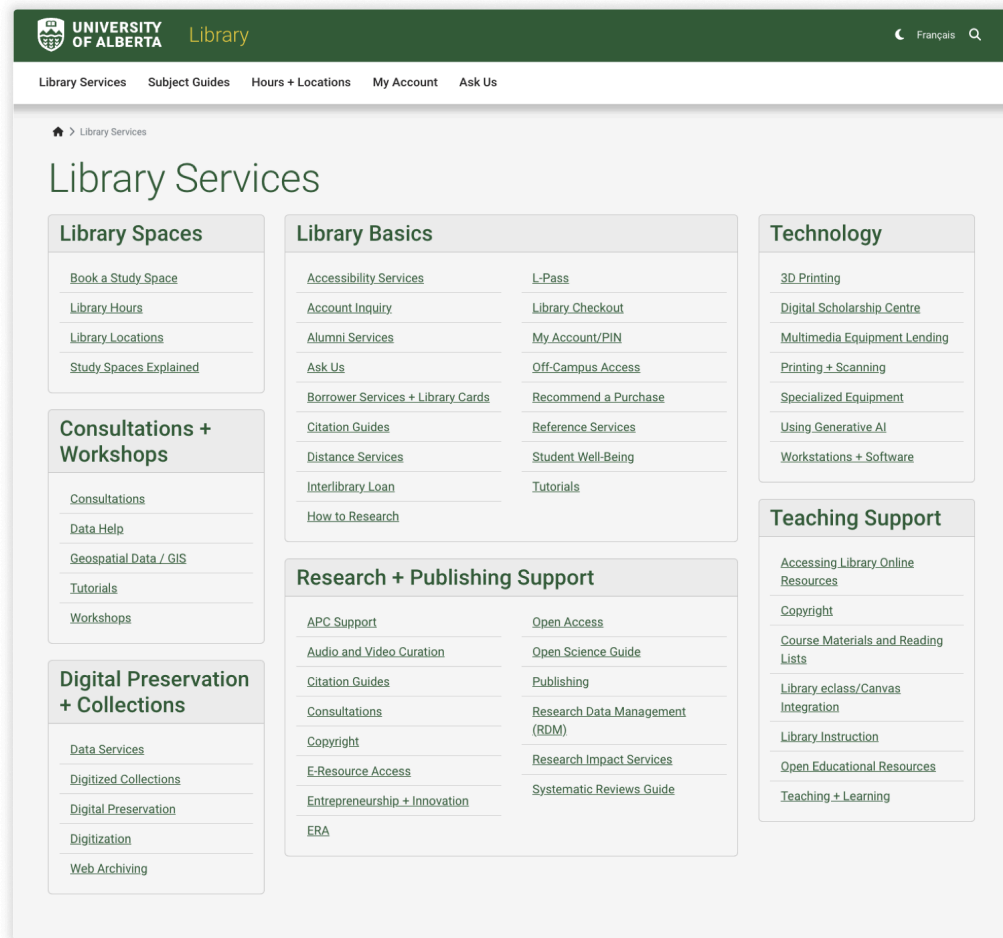

Figure 4.1 The current library services page

RECOMMENDATION

Reorganize services into a grouped listing with descriptions, while boosting popular services.

1) Prioritize popular services at the top

The most popular services should be brought to the top of the screen. Students tend to use only 2–3 services frequently, The most used services should therefore be prioritized. We selected these services based on insights from the 8 interviews and our

assessment of their importance. However, the final selection can be refined using web analytics to track which services are most frequently used. (see fig 4.2)

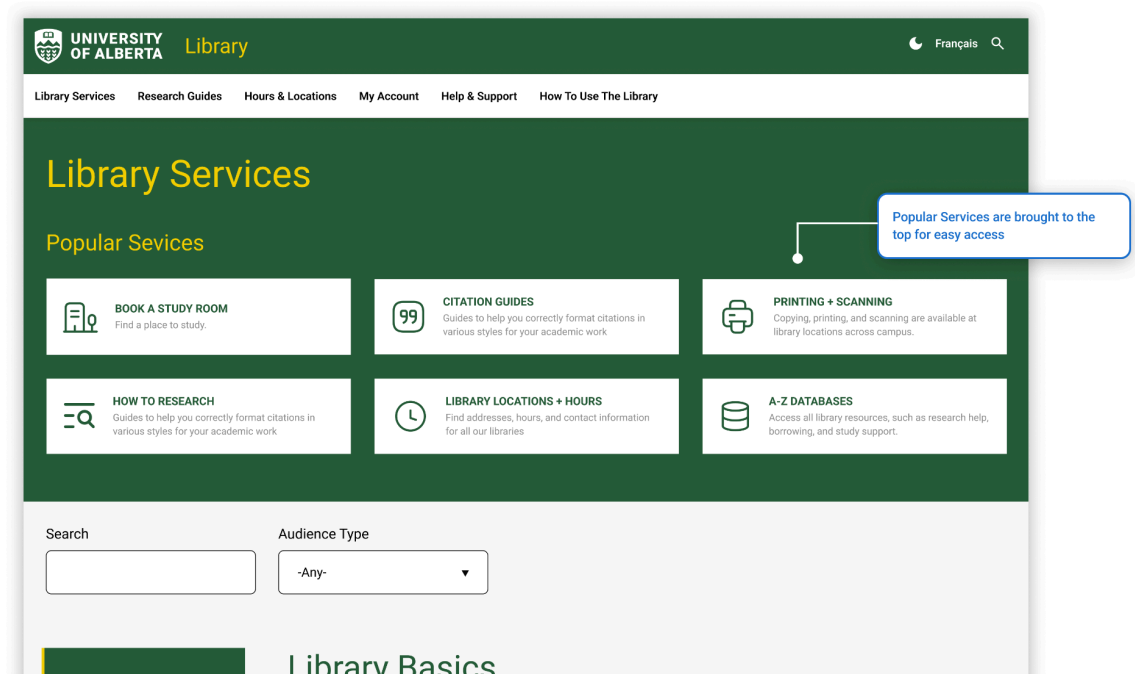

Figure 4.2 The popular services are prominently displayed for easy access

2) Adopt a list view with grouped categories

Services will be displayed in a structured list under relevant categories (e.g., Research Support, Student Services, Faculty Resources). This approach reduces the cognitive load by presenting a smaller number of options within a focused context, rather than overwhelming users with all services at once. (see fig 4.3)

3) Include descriptions under each service

Each service will have a brief, clear description to explain its purpose. This eliminates confusion caused by ambiguous or misleading service names like "ERA" or "Student Wellbeing." (see Figure 4.3)

4) Incorporate a search bar for quick navigation

A search bar will enable users to quickly locate specific services without needing to browse through categories manually. In testing, one student struggled to find a service and resorted to using "Ctrl + F." Having an integrated search option would be useful, as most users tend to rely on search when it's available. This was a common user behavior we observed during testing as well. (see Figure 4.3)

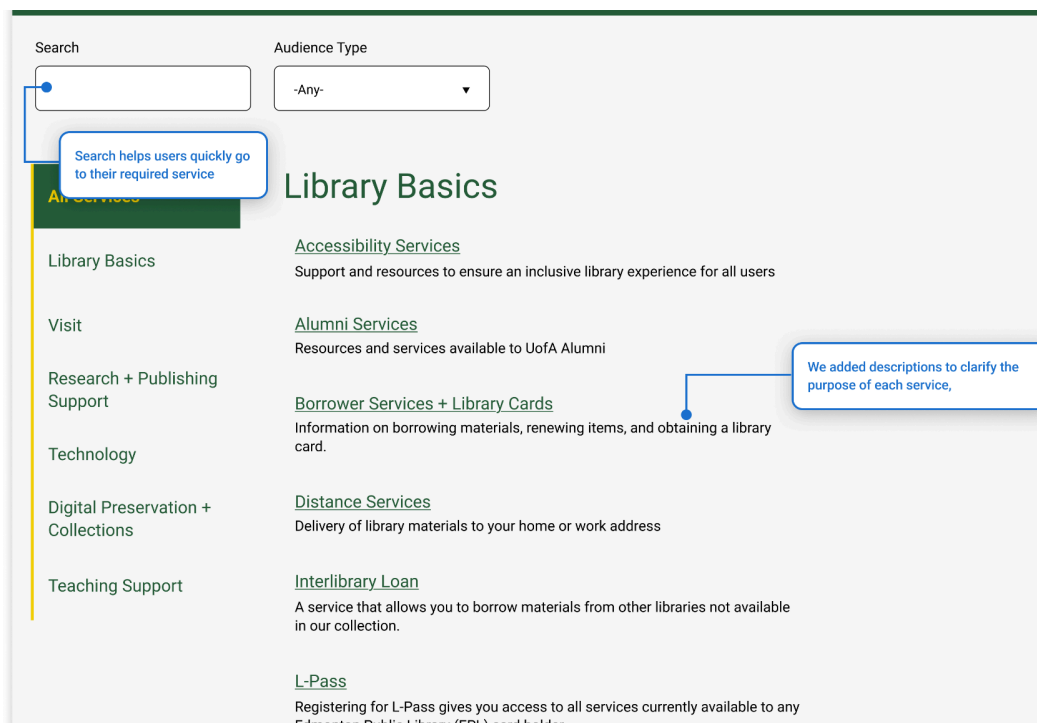

Figure 4.3 Revised Services Page

5) Add a sticky side navigation menu

A sticky side navigation panel will allow users to jump between categories easily, improving their ability to find services without scrolling excessively. (see Figure 4.4)

6) Add an audience-specific filter

A filtering option will allow users to customize the displayed services based on their needs (e.g., undergraduate students, graduate students, researchers, alumni, or faculty).

This ensures users see only the services relevant to them, reducing clutter and improving usability. (see Figure 4.4)

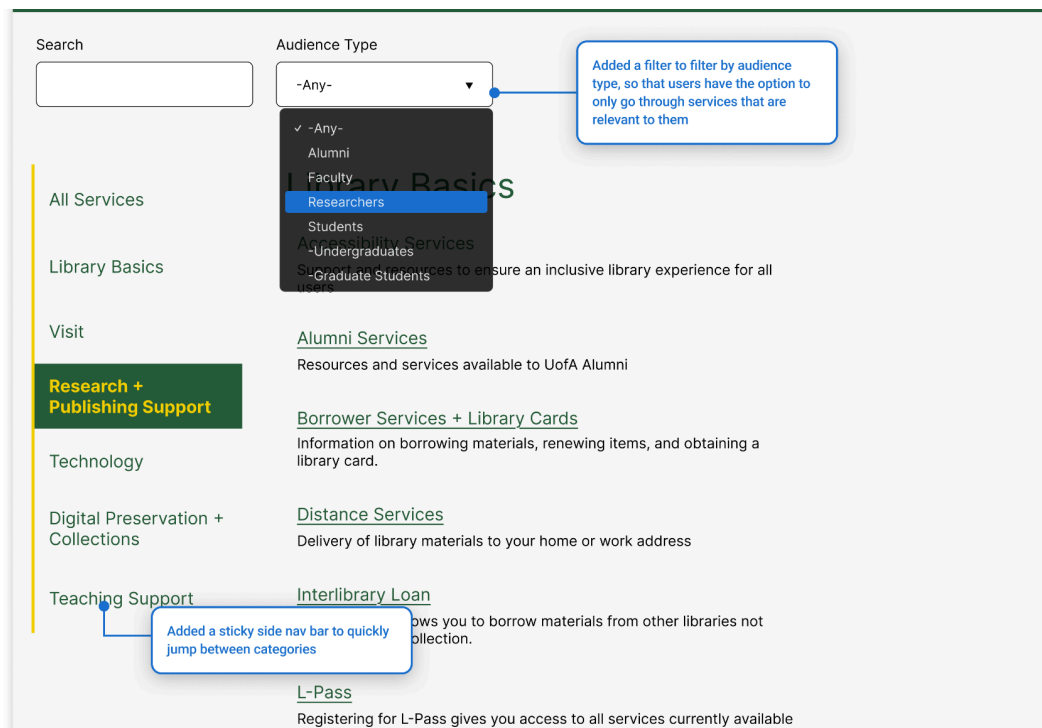

Figure 4.4 Sticky side navigation and an audience-specific filter

Conclusion

The University of Alberta's Library plays an important role in providing academic support for students and researchers. While the library website has a strong foundation, especially with its easy-to-use search functionality and access to essential tools and resources, our moderated usability testing identified some opportunities to further enhance the user experience and make the website more intuitive and accessible.

The homepage successfully highlights key features like search, but its remaining content lacks engagement and relevance to diverse users. The Library Services page has a lot of great resources and is organized in categories but it can feel overwhelming, making it challenging to navigate and find relevant content, especially for new students. Subject guides that the library offers, while valuable for research, are difficult to locate and understand due to confusing organization. Additionally, the hours and locations page, though frequently used, needs clearer campus-specific details to help new users identify the best library for their needs.

By addressing these areas of improvement — adding more student-focused content on the home page, categorizing resources with clear descriptions on the library services page, organizing the subject guides with collapsible drawers, improved categories, and updated content, and including campus-specific location information and daily hours — would allow the library website to better support student's academic journeys and get the most out of everything the library has to offer.

Share your Feedback! Participate in a UofA Library website usability study

From: University of Alberta Library | User Experience Design & Planning

The University of Alberta Library is collaborating with graduate students from the [Pratt Institute's Center for Digital Experiences](#) to conduct a brief usability study that will help improve the library website.

We are recruiting UofA students (undergraduate or graduate students in any program) to share their feedback and experiences about the website. If you are interested, please complete the following questionnaire by Friday, November 29. You may be selected to participate in an interview. Participants will receive a \$10 ONEcard credit.

If you have any questions, please contact Caeleigh Steier (Head, User Experience Design & Planning) at caeleigh.steier@ualberta.ca.

[Sign up to participate](#)

Appendix F: Task List

HOMEPAGE

1. Take time to explore the home page and talk about what you find interesting or useful.
2. Can you show me how you would plan a visit to the library through the website?
 - a. *Probe for: Which features did the user look at?*
3. Suppose you were writing a research paper Which resources would you look to avail from the library to help your academic process?
 - a. *Probe for: Do they go to library services?*
 - b. *Probe for: Which services do they utilize/where do they click?*

4. Imagine you are conducting a study in the Computing Science domain. Can you find resources on that topic that may be helpful to you?
 - a. *Probe for: the trajectory taken by the user?*
 - b. *If not landed on SUBJECT GUIDES:* Can you navigate to the subject guides page and do the same?
 - c. When on the right page: Can you talk us through what you find interesting or useful on this page? What do you think about the organization here?

LIBRARY SERVICES PAGE

1. Have you used the library services page before?
 - a. *If no:* What would you expect to find on the “Library Services” page? Anything specific?
 - b. *If yes:* What service did you utilize?
2. Go to the page. Did you find what you expected?
 - a. What is different from / aligns with what you expected?
3. How do you feel about the overall organization of the page? How easy or difficult is it to find what you need?
4. Can you walk me through how you would go about booking a room to study in?
5. What is your favorite class that you are taking right now? Can you use the library website to find the assigned materials for that course? (*Backup course: Science 30*)
6. If you need academic help with the class, please show me services that may be helpful to you.
7. If you want to print material for class, can you find the cost of printing and locate the nearest printer around you?
8. Which categories did you find the most useful?
 - a. In those categories, which services seem the most helpful to you?

POST-TEST QUESTIONS

1. Are there any challenges or frustrations you face when using this website? Why or why not?
 - a. *Optional:* Can you look for information that may help you tackle this challenge through the website?
2. Is there anything you'd like to see on this page that is not here?
